Hotel &  
Parking

Church

Tours

Health Care

Transit

## Why Diamond?

**Rust free** - In cities with high amounts of rain, snow, sea salt, or calcium chloride, rust will commonly develop in the stepwell, wheel wells, and along door frames of metal buses. Diamond buses **do not rust** because of its all composite construction.

**Smooth, quiet ride** – Unlike metal buses that creak with every bump and turn, Diamond’s all composite construction is smooth and quiet. Diamond buses provide superior sound dampening. For example, Diamond sidewalls **are never** glued, taped, or filled with Styrofoam. Diamond also installs thick rubber pads between the “I-Beams” and floor to help cushion the ride while reducing road noise.

**Impact resistant** – Try this experiment. Obtain a cross section piece of a Diamond bus and one from a metal competitor. Place each cross section on the ground. Next, hit both pieces with the same amount of force using a mallet. Which piece retains its form and would be easier to maintain for the life of the vehicle?

**Superior Temperature Efficiency** – Diamond buses are easier to cool / heat than metal constructed buses. Why? Diamond’s all composite construction has superior insulation properties making it far easier to cool and heat than a metal bus. This makes for happier riders.

**No repainting** – The exterior of a Diamond bus is finished with a durable gelcoat material. After years of use and abuse, simply hand wash the exterior, buff with wax, and enjoy the “nearly new” finish return all without repainting.

**No waves** - Waves are great for surfing, just not on the side of a bus. With Diamond’s three seam construction process, waves will not appear or create issues with graphics.

“Our residents love our new Diamond VIP 2000. It **eliminates having to shout** over the squeaks and creaks of the old metal bus. This is especially helpful on the longer road trips.”
